

Day 2 – Shell Scripting: Variables, Inputs & Conditions

Objective:

Learn variables, user input, command-line arguments, and numeric conditions used in real-world shell scripts.

1. Variables

Variables store values that can be reused.

Example: `NAME="Jawaid"`

2. User Input

Use the `read` command to take input from users.

Example: `read -p "Enter your name: " NAME`

3. Command-Line Arguments

`$0` – Script name

`$1`, `$2` – Input arguments

`$#` – Number of arguments

4. Empty and Non-Empty Checks

`-z` checks if variable is empty

`-n` checks if variable is not empty

5. Numeric Comparisons

`-eq`, `-ne`, `-gt`, `-lt`, `-ge`, `-le`

6. Real DevOps Practice Scripts

- Positive / Negative / Zero check

- Find greater number

- Disk usage monitoring script

Disk Usage Script (Final):

```
USAGE=$(df -h / | awk 'NR==2 {print $5}' | sed 's/%//')
```

Best Practices:

- Validate inputs
- Quote variables
- Use exit codes
- Keep scripts readable
